

16th August 2026

Hey Jamal Haneef Ahmed,

Based on our analysis, if you had switched to solar energy two years back, your savings and requirement would have been,

TOTAL SAVINGS

₹4,536

REQUIRED SOLAR KW

12 kW

As you will see, installation of a boundless source of free energy such as solar power will amount to momentous savings as shown with the help of actual data from the past 12 months in the case study report. Below is a chart detailing your consumption over the last 24 months, in bimonthly cycles.

Below is a comparison of power consumption in KWh (units) versus the cost incurred. Notice how cost increases a lot more in relation to a small increase in consumption.

Also note how the consumption and cost peaks in the summer months. Massive savings can be gained once the power consumption falls below a certain threshold.

Period	No. of Units consumed	Bill Amount (Rs.)	Savings w/ Solar
2026-Q3	1401	12090	6486
2026-Q2	2813	24180	12928
Totals	4,214	₹36,270	₹19,414

The data consists of energy consumption during the past 24 months. The aim of this table is to show the power requirement (Consumption in kilowatt per hour) of the premises during the past two year period. As this parameter varies depending on many factors such as climate, holidays, religious festivals, power efficiency of electrical appliances used etc, we can calculate an average of **11.7 KW/Hr** over past two years as the minimum power requirement of the premises to reduce power consumption by 100% as of the last billing cycle.

Max Consumption: **1401** Units
Min Consumption: **1401** Units
Avg Consumption: **1401** Units
Avg Cost: **₹12,090**
Avg Cost w/ Solar: **₹5,604**

Max Consumption: **1289** Units
Min Consumption: **1289** Units
Avg Consumption: **1289** Units
Avg Cost: **₹10,090**
Avg Cost w/ Solar: **₹5,156**

Note how the electricity usage peaks in the months of **Jun-Jul 2026** and **Apr-May 2026**.

Kindly find the conclusion and recommendation on the next page!

Conclusion & Recommendation

This study was carried out on data gathered from actual facts and numbers. The rise in electricity bills has to do with the fact that our earth is running out of fossil fuel based energy sources. And prices rise when a particular commodity becomes scarce. But the good news is that the technology which helps us and our earth is here, using the sun's boundless free power is the best source of energy one can get. With Daystar Solar implementing this technology with expertise becomes as easy as a phone call.

On a general note rise in power costs occur due to the fact that you are dependent on external factors such as diesel generators, battery based UPS and grid energy, the eventual costs of which are decided based on market factors. Hence rendering power saving plans ineffective if prices of non-renewable energy sources continue to rise. As of now, your premises requires on average, **11.7 KW/Hr** of power everyday during sunshine hours. Dependence on solar power will reduce this risk of electricity price escalation which is the greatest threat to your costs. Since most of the power consumption hours are during the peak power production of solar power plants, there arises a salient need to generate your own power using the sun's unbounded and free energy for years to come.

Henceforth having collected, analysed and processed the data, we are able to qualitatively prove that you stand to benefit greatly if a solar power plant is commissioned for captive power use. We hope you take into consideration all our research and base a decision for the benefit of yourself and the environment to become a leading example for sustainability in Chennai.
